VSN HOME

WHOLESALE GROCERY ORDERING AND INVENTORY MANAGEMENT APPLICATION

Agile and Scrum Assignment Report

Student: D. V. Sai Kumar

Jira Project Key: VSG

Business Scenario

A wholesale grocery business needs a digital application to help customers browse bulk grocery products, check prices and availability, place wholesale orders, and track order status. The system also supports store staff in updating product information, monitoring stock, reviewing orders, and managing offers. The application is intended to reduce manual order handling, improve stock visibility, and make the wholesale purchasing process more convenient.

Task 1 – Product Vision and Stakeholder Mapping

Product Vision: VSN HOME is a wholesale grocery ordering and inventory management application that allows customers to view grocery products sold in bags, cartons, and bulk quantities, place orders, and receive order updates. It helps store staff maintain product details, manage inventory, process orders, and review sales information through a single digital platform.

Stakeholder Mapping

Stakeholder	Scrum role mapping	Main responsibility
Wholesale customers	Customer	Browse bulk products, check prices, place orders, and view order status.
Store owner / business representative	Product Owner	Defines product goals, prioritises the backlog, and accepts completed features.
Scrum facilitator	Scrum Master	Coordinates Scrum events and helps remove team impediments.
Application development team	Developers	Design, develop, test, and integrate the application modules.
Store employees	Customer / stakeholder	Update stock, confirm orders, and provide feedback on daily workflows.
Delivery / dispatch staff	Customer / stakeholder	Use order details to prepare and dispatch customer purchases.
Technical support / security staff	Stakeholder consulted	Advise on access control, data protection, backups, and technical constraints.

The Product Owner, Scrum Master, and Developers form the core Scrum accountabilities. Customers and store stakeholders provide requirements and feedback so that the application supports actual wholesale business operations.

Task 2 – Epics and User Stories

Four Epics and twelve User Stories are defined for the VSN HOME wholesale grocery application. The Jira key prefix used in this sample backlog is VSG.

Epic	Jira ID	User Story
Product Catalogue	VSG-21	As a customer, I want to view the wholesale grocery product catalogue so that I can find products for bulk purchase.
Product Catalogue	VSG-22	As a customer, I want to view product prices and package quantities so that I can compare bulk purchasing options.
Product Catalogue	VSG-23	As a customer, I want to search products by name or category so that I can locate items quickly.
Order Management	VSG-24	As a customer, I want to add products to a cart so that I can prepare an order before checkout.
Order Management	VSG-25	As a customer, I want to submit my wholesale order so that the store can process my purchase.
Order Management	VSG-26	As a customer, I want to view my previous and current orders so that I can track my purchases.
Inventory Management	VSG-27	As store staff, I want to update product stock quantities so that the catalogue reflects current availability.
Inventory Management	VSG-28	As store staff, I want to edit product details and prices so that customers see correct information.
Inventory Management	VSG-29	As store staff, I want to receive a low-stock indication so that I can plan product replenishment.
Sales and Customer Support	VSG-30	As a store owner, I want to view sales summaries so that I can review business performance.
Sales and Customer Support	VSG-31	As a customer, I want to receive order status updates so that I know whether my order is being processed or dispatched.
Sales and Customer Support	VSG-32	As a customer, I want to send feedback about my order so that the store can improve its service.

All twelve stories are grouped under their corresponding parent Epics in the proposed VSG Jira backlog. The IDs are sample project identifiers and should be replaced if a different Jira project key is assigned.

Task 3 – INVEST Review

Element	Review applied to VSN HOME stories
Independent	Catalogue, cart, order, inventory, and feedback stories describe separate capabilities that can be developed in manageable increments.
Negotiable	The team and Product Owner can discuss implementation details, such as how stock updates and order status are displayed.
Valuable	Each story provides value to customers, store staff, or the store owner by improving ordering or business operations.
Estimable	Each story has a defined outcome that the team can discuss and estimate using relative story points.
Small	Stories focus on one main user action. Larger features can be split into smaller stories during backlog refinement.
Testable	Each story can be checked through visible application behaviour, such as product search results, cart updates, or stock changes.

Refinement: Separating product browsing, cart preparation, order submission, and inventory updates makes the backlog easier to understand, estimate, develop, and test.

Task 4 – Given / When / Then Acceptance Criteria

VSG-23 – Search products
Given: The customer has opened the product catalogue.
When: The customer enters a product name or selects a category.
Then: The application displays matching products or a clear no-results message.

VSG-24 – Add products to cart
Given: The customer is viewing an available product.
When: The customer selects a package quantity and adds the product to the cart.
Then: The cart displays the selected product, quantity, and calculated item amount.

VSG-25 – Submit a wholesale order
Given: The cart contains valid products and quantities.
When: The customer confirms the order.
Then: The application records the order and displays an order confirmation.
And: If an item is unavailable, the application informs the customer and asks them to review the cart.

VSG-27 – Update product stock
Given: Store staff have access to the inventory section.
When: Staff enter and save a revised stock quantity.
Then: The application stores the updated quantity and displays the latest stock value.

VSG-31 – Receive order status updates
Given: The customer has placed an order.
When: Store staff change the order status.
Then: The customer can view the latest order status in the application.

Task 5 – Prioritisation and Planning Poker

The backlog is prioritised according to customer value, operational importance, and relative implementation effort. Product discovery and order placement are prioritised because they form the main customer journey. Inventory and sales-support capabilities help the store operate effectively.

Jira ID	Story	Priority	Points
VSG-21	View wholesale product catalogue	High	3
VSG-22	View prices and package quantities	Medium	2
VSG-23	Search products by name or category	High	3
VSG-24	Add products to cart	Highest	5
VSG-25	Submit wholesale order	Highest	5
VSG-26	View current and previous orders	Medium	2
VSG-27	Update product stock quantities	High	3
VSG-28	Edit product details and prices	Medium	2
VSG-29	Show low-stock indication	Medium	3
VSG-30	View sales summaries	Low	2
VSG-31	View order status updates	High	3
VSG-32	Submit order feedback	Low	2
	TOTAL		**35**

Planning Poker: Team members discuss each story, clarify its scope, select Fibonacci-based estimates, reveal estimates together, and discuss differences before agreeing on a final value. The sample backlog total is 35 story points.

Story points versus hours: Hours estimate time. Story points represent relative effort, complexity, uncertainty, and risk. A 5-point story is considered more complex than a 2-point story; it does not mean five hours.

Task 6 – Jira Backlog, Definition of Ready and Definition of Done

The proposed VSG backlog contains twelve user stories grouped under four Epics. The following checklists can be published in the team's project documentation space and used during backlog refinement and sprint review.

Definition of Ready (DoR)

Checklist item	Description
Clear user story	The story explains who needs the feature and what outcome is required.
Acceptance criteria	Conditions for successful completion are written and understandable.
INVEST review	The story is independent, negotiable, valuable, estimable, small, and testable.
Dependencies identified	Required access, data, or related tasks are identified.
Priority assigned	The Product Owner has assigned a business priority.
Story points estimated	The team has discussed and agreed on a relative estimate.

Definition of Done (DoD)

Checklist item	Description
Development completed	The feature is implemented according to the agreed story scope.
Code reviewed	The code has been reviewed by another team member.
Tests passed	Relevant unit and functional tests pass successfully.
Acceptance criteria met	The completed feature satisfies all agreed acceptance criteria.
No critical defects	No unresolved critical or blocking defects remain.
Documentation updated	Relevant technical or user documentation is updated.

Purpose: The Definition of Ready ensures that a story is sufficiently clear before the team starts work. The Definition of Done ensures that completed work meets the agreed quality standards and is ready for delivery.

Jira and Documentation Evidence

For the final submission, attach your own screenshots from the VSG Jira project showing the four Epics, twelve user stories, issue IDs, priorities, and estimates. Also attach a screenshot of the page where the DoR and DoD checklists are published. The source PDF's hospital-project screenshots should not be reused as evidence for this grocery application.

Suggested evidence captions

1. Jira backlog – VSN HOME: shows the four Epics and twelve user stories with their priorities and story-point estimates.
2. Project documentation – Definition of Ready: shows the six readiness checklist items.
3. Project documentation – Definition of Done: shows the six completion and quality checklist items.
